The different generation of Programming Languages

Since the discovery of computers, several generation of programming languages were created.

- ▶ The first-generation programming languages
- ▶ The second-generation programming languages
- ▶ The third-generation programming languages

Why ?

Python developers have developed several different kind of libraries for various purposes such as IOs (writing and reading files), mathematical operation (exponential, logarithm,...), matrix operations (diagonalisation, inversino, transpose, ...) ...

↳ It can be useful to call them

How to call them ?

Either from the interpreter or the scripts, libraries are called using the following line (in the example, we will import the « math » library)

- ▶ `import math` (this is for the whole library)
- ▶ `from math import exp` (for importing only the « sqrt » routine of the « math » library)

Conditional loops
Conditional loops

How ?

For this, you should first import the « csv » library.

Then, you can define a function like this :

« `ecriture=open('filename','wb')` » where filename is the name of the file.

Thus you can write in this file using this :

« `ecriture.write('what you want to write')` »

If you want to go to the new line, this can be done like this : « `\n` »

A remind about the « cat » Unix command

The « cat » Unix command allows you to display the content of a file on the screen.
When redirecting it to a Python variable, it allows you to read a file.

matplotlib

What is a subroutine ?

A subroutine is a part of the code that could be considered as outside of the code (STRANGE!!!).

A subroutine take « arguments » and return « outputs ».

A subroutine : Why ?

Most of the time, it is used when you aims at doing a particular series of operation several times.

Subroutines

The numpy library

matplotlib

How to create it and call it?

```
from math import exp
def sub_name(entry):    # Creates a subroutine sub_name taking entry as input
    a = exp(entry)
    return(a)           # return the value of a

b=3.5
f=sub_name(b)           #attribute the output of the subroutine to a variable f
print f
```

Subroutines

The numpy library

matplotlib

Another reason to write subroutines

Make your program more readable and understandable. Indeed, when you are creating a program, try to do the following :

1. Write the most subroutines as you can (it helps splitting the operations and so help for debugging)
2. Write the smallest « main » part as possible.

Subroutines

The numpy library

matplotlib

1. Subroutines

2. The numpy library

3. matplotlib

Subroutines

The numpy library

matplotlib

Why to learn Numpy ?

This is one of the most powerful python library for

import Numpy

Most of the time, people are importing Numpy like this :

« Import numpy as np »

How to create a 0 matrix or array ?

`f=np.zeros(3)` creates a 3 value long array set to 0.

`f=np.zeros((3,3))` creates a 3*3 values set to 0.

Subroutines

The numpy library

matplotlib

Some useful matrix operators

`np.transpose` for matrix transposition

`np.dot` for dot product

`np.linalg.det` for the determinant

`np.linalg.inv` for matrix inversion

`np.linalg.solve` for solving linear equations

`np.linalg.eigvals` for eigenvalues

Subroutines

The numpy library

matplotlib

1. Subroutines

2. The numpy library

[Subroutines](#)[The numpy library](#)[matplotlib](#)

Aim

Is a library that allows you to plot your data

Subroutines

The numpy library

matplotlib

Aim

Is a library that allows you to plot your data

How to call the library ?

Most of the time, the library is called like this :
`import matplotlib.pyplot as plt`

Subroutines

The numpy library

matplotlib

1. creating the lists to be plotted

We will plot the results of $y=2.x$ equation.

```
pr075014:fin rmarchal$ python
Python 2.7.14 (default, Sep 22 2017, 00:06:07)
[GCC 4.2.1 Compatible Apple LLVM 8.1.0 (clang-802.0.42)]
on darwin
Type "help", "copyright", "credits" or "license" for more
information.
>>> import matplotlib.pyplot as plt
>>> X=[]
>>> Y=[]
>>> for i in range(0,10):
...     X.append(i)
...     Y.append(2*i)
...
>>> □
```

2. scatter plot

We will plot the results of $y=2.x$ equation as scatter.

```
>>> plt.scatter(X,Y)
<matplotlib.collections.PathCollection object at 0x1130ce250>
>>> plt.show()
```

Subroutines

The numpy library

matplotlib

2. scatter plot

We will plot the results of $y=2.x$ equation as scatter.

```
>>> plt.scatter(X,Y)
<matplotlib.collections.PathCollection object at 0x1130ce250>
>>> plt.show()
```

And the following figure will appear

Subroutines

The numpy library

matplotlib

3. line plot

We will plot the results of $y=2.x$ equation as curve.

```
[>>> plt.plot(X,Y)
[<matplotlib.lines.Line2D object at 0x119ef0f90>]
[>>> plt.show()
```

Subroutines

The numpy library

matplotlib

3. line plot

We will plot the results of $y=2.x$ equation as curve.

```
[>>> plt.plot(X,Y)
[<matplotlib.lines.Line2D object at 0x119ef0f90>]
[>>> plt.show()
```

And the following figure will appear

Subroutines

The numpy library

matplotlib

Subroutines

The numpy library

matplotlib

4. save the figure in a file

We will plot the results of $y=2.x$ equation as curve.

```
>>> plt.plot(X,Y)
[<matplotlib.lines.Line2D object at 0x11a1e7d50>]
>>> plt.savefig('figure.pdf')
```

Subroutines

The numpy library

matplotlib

4. save the figure in a file

We will plot the results of $y=2.x$ equation as curve.

```
>>> plt.plot(X,Y)
[<matplotlib.lines.Line2D object at 0x11a1e7d50>]
>>> plt.savefig('figure.pdf')
```

And the file figure.pdf will be created

5. let add a legend

We will plot the results of $y=2x$ equation as curve.

```
[>>> plt.plot(X,Y,label="y=2*x")  
[<matplotlib.lines.Line2D object at 0x119f0bd50  
>]  
[>>> plt.legend()  
<matplotlib.legend.Legend object at 0x1103ef850  
>  
[>>> plt.show()
```

Subroutines

The numpy library

matplotlib

5. let add a legend

We will plot the results of $y=2x$ equation as curve.

```
[>>> plt.plot(X,Y,label="y=2*x")  
[<matplotlib.lines.Line2D object at 0x119f0bd50  
>]  
[>>> plt.legend()  
<matplotlib.legend.Legend object at 0x1103ef850  
>  
[>>> plt.show()]
```

And the following figure will appear

Subroutines

The numpy library

matplotlib

6. let add axis label and title

We will plot the results of $y=2x$ equation as curve.

```
>>> plt.plot(X,Y,label="y=2*x")  
[<matplotlib.lines.Line2D object at 0x11a2b0210  
>]  
>>> plt.xlabel("X")  
<matplotlib.text.Text object at 0x113753090>  
>>> plt.ylabel("Y")  
<matplotlib.text.Text object at 0x119f1acd0>  
>>> plt.title("curve")  
<matplotlib.text.Text object at 0x11a271f10>  
>>> plt.show()
```

Subroutines

The numpy library

matplotlib

6. let add axis label and title

We will plot the results of $y=2 \cdot x$ equation as curve.

```
>>> plt.plot(X,Y,label="y=2*x")  
[<matplotlib.lines.Line2D object at 0x11a2b0210>]  
>]  
>>> plt.xlabel("X")  
<matplotlib.text.Text object at 0x113753090>  
>>> plt.ylabel("Y")  
<matplotlib.text.Text object at 0x119f1acd0>  
>>> plt.title("curve")  
<matplotlib.text.Text object at 0x11a271f10>  
>>> plt.show()
```

And the following figure will appear
